The butterfly lemma
Ken Brown, Cornell University, August 2011

Given $A_1 \trianglelefteq A \leq G$ and $B_1 \trianglelefteq B \leq G$, we can use each of the chains

$$\begin{array}{c} A \\ | \\ A_1 \end{array} \quad \begin{array}{c} B \\ | \\ B_1 \end{array}$$

to refine the other. This yields

$$\begin{array}{c} A \\ | \\ A_1(A \cap B) \\ \textcolor{blue}{|} \\ A_1(A \cap B_1) \\ | \\ A_1 \end{array} \quad \begin{array}{c} B \\ | \\ B_1(A \cap B) \\ \textcolor{blue}{|} \\ B_1(A_1 \cap B) \\ | \\ B_1 \end{array}$$

The content of the butterfly lemma is that the two quotients indicated by heavy blue lines are isomorphic. It is not even obvious a priori how to map either quotient to the other. But we will do this by introducing a third quotient that maps to both of them via inclusion maps:

$$\begin{array}{ccccc} A & & & & B \\ | & & & & | \\ A_1(A \cap B) & & & & B_1(A \cap B) \\ & \searrow & & \swarrow & \\ & & \textcolor{blue}{|} & & \\ & \swarrow & & \searrow & \\ A_1(A \cap B_1) & & & & B_1(A_1 \cap B) \\ | & & & & | \\ A_1 & & & & B_1 \end{array}$$

What groups should appear at the top and bottom of the middle blue line? At the top we need something that is contained in both $A_1(A \cap B)$ and $B_1(A \cap B)$; an

obvious candidate is $A \cap B$. This forces what we put at the bottom. Indeed, if we want to prove the lemma by applying the second isomorphism law, the group at the bottom should be $A_1(A \cap B_1) \cap (A \cap B)$, and it should also be $B_1(A_1 \cap B) \cap (A \cap B)$. Fortunately these two intersections are equal; in fact, we will show in class that they are both equal to $(A_1 \cap B)(A \cap B_1)$, and the proof will follow easily:

Although the proof is done, we can add two more groups to make the picture look a little more like a butterfly:
