t-Distribution

2-sample inference based on the sampling distribution of $\hat{p}_1 - \hat{p}_2$

Find a CI for $p_1 - p_2$:

$$SE(\hat{p}_1 - \hat{p}_2) = \sqrt{\frac{\hat{p}_1 \hat{q}_1}{n_1} + \frac{\hat{p}_2 \hat{q}_2}{n_2}}$$

Same argument as in the 1-sample case gives a CI for $p_1 - p_2$ of

$$\hat{p}_1 - \hat{p}_2 \pm z^* SE(\hat{p}_1 - \hat{p}_2).$$

300 stdnts, 60% approve; 200 faculty, 65%

2-sample inference based on the sampling distribution of

$$\hat{p}_1 - \hat{p}_2$$

Find a CI for $p_1 - p_2$:

$$SE(\hat{p}_1 - \hat{p}_2) = \sqrt{\frac{\hat{p}_1 \hat{q}_1}{n_1} + \frac{\hat{p}_2 \hat{q}_2}{n_2}}$$

Same argument as in the 1-sample case gives a CI for $p_1 - p_2$ of

$$\hat{p}_1 - \hat{p}_2 \pm z^* SE(\hat{p}_1 - \hat{p}_2).$$

Here we have

$$SE(\hat{p}_1 - \hat{p}_2) = \sqrt{\frac{.6 \cdot .4}{300} + \frac{.65 \cdot .35}{200}} = .0440.$$

300 stdnts, 60% approve; 200 facilty, 65%

2-sample inference based on the sampling distribution of

$$\hat{p}_1 - \hat{p}_2$$

Find a CI for $p_1 - p_2$:

Same argument as in the 1-sample case gives a CI for $p_1 - p_2$ of

$$\hat{p}_1 - \hat{p}_2 \pm z^* SE(\hat{p}_1 - \hat{p}_2).$$

Here we have

$$SE(\hat{p}_1 - \hat{p}_2) = \sqrt{\frac{.6 \cdot .4}{300} + \frac{.65 \cdot .35}{200}} = .0440.$$

A 95% CI for $p_1 - p_2$ is:

$$(.6 - .65) \pm 1.96 \cdot .0440 = -.05 \pm .0863 = (-.1363, .0363).$$

t-Distribution

Carry out an HT at a sig level of $\alpha = .05$ of whether faculty and student approval rates are different. Calculate the P-value as well.

Our hypotheses are:

- $H_0: p_1 = p_2$
- $H_a: p_1 \neq p_2$

A twist enters. We are only interested in the reasonableness of our observed $\hat{p}_1 - \hat{p}_2$ with respect to the sampling dist if H_0 is true. There are many such distributions (since we don't know the common value of $p_1 = p_2$ to use.) In particular what we did with $SE(\hat{p}_1 - \hat{p}_2)$ above does not fit the $p_1 = p_2$ situation.

300 stdnts, 60% approve; 200 faculty, 65%

Carry out an HT at a sig level of $\alpha = .05$ of whether faculty and student approval rates are different. Calculate the P-value as well.

Our hypotheses are:

- $H_0: p_1 = p_2$
- $H_a: p_1 \neq p_2$

We resolve this conflict by making our best estimate of the common value of p_1 and p_2 , namely the weighted average

$$\hat{p}_{pooled} = \frac{n_1 \hat{p}_1 + n_2 \hat{p}_2}{n_1 + n_2}$$

and then

$$SE_{pooled}(\hat{p}_1 - \hat{p}_2) = \sqrt{\frac{\widehat{p}_{pooled} \widehat{q}_{pooled}}{n_1} + \frac{\widehat{p}_{pooled} \widehat{q}_{pooled}}{n_2}}$$

t-Distribution

A company is criticized because only 13 of 43 people in executive-level positions are women. The company explains that although this proportion is lower than it might wish, it's not surprising given that only 40% of all its employees are women. What do you think? Test an appropriate hypothesis and state your conclusion.

Notation: Let p_2 denote the proportion of Store Brand which are contaminated and p_3 the proportion for Yson.

Hypotheses:

- $H_0: p_2 = p_3$
- $H_a: p_2 \neq p_3$

t-Distribution

- 1 33% of 75 Perdue chickens contaminated.
- 2 45% of 75 Store Brand chickens contaminated.
- 3 56% of 75 Tyson chickens contaminated.

Question: Tyson different in safety than Store Brand?

Still $\hat{p}_{pooled} = .505$, $SE_{pooled}(\hat{p}_2 - \hat{p}_3) = .0816$, $z = -1.35$.

t-Distribution

- 1 33% of 75 Perdue chickens contaminated.
- 2 45% of 75 Store Brand chickens contaminated.
- 3 56% of 75 Tyson chickens contaminated.

tail probability = $P(Z < -1.35) = .0885$.

P-value = $2(\text{tail probability}) = 2(.0885) = .177$

At a level of $\alpha = .05$, we'd retain H_0 .

Tyson might not have a different level of safety than Store Brand.

Confidence interval for difference in safety between Store Brand and Tyson?

$$SE_{pooled} = \sqrt{\frac{.45 \cdot .55}{75} + \frac{.56 \cdot .44}{75 + 75}} = .0812$$

A 95% CI for $p_2 - p_3$ would be

$$-.11 \pm 1.96 \cdot .0812 = -.11 \pm .159 = (-.269, .049)$$

A 95% CI for $p_2 - p_3$ would be

$$-.11 \pm 1.96 \cdot .0812 = -.11 \pm .159 = (-.269, .049)$$

The fact that this CI contains 0 is another way of doing the last 2 HT's.
