Proof of
Normal
Approximation

You poll 100 people.

What is the probability that between 60 and 65 report approval?

(including 60 and 65.)

Solution: Let $X = \text{Binomial}(100, .7)$

X has mean

$$\mu = (100)(.7) = 70$$

and

$$\sigma = \sqrt{(100)(.7)(.3)} = \sqrt{21} = 4.58.$$

Suppose 70% approve the President ...

You poll 100 people.

What is the probability that between 60 and 65 report approval?

(including 60 and 65.)

Solution: Let $X = \text{Binomial}(100, .7)$

X has mean

$$\mu = (100)(.7) = 70$$

and

$$\sigma = \sqrt{(100)(.7)(.3)} = \sqrt{21} = 4.58.$$

X will then be approximated by a *normal* distribution Y with the same mean and standard deviation.

Proof of
Normal
Approximation

Suppose 70% approve the President ...

You poll 100 people.

What is the probability that between 60 and 65 report approval?

(including 60 and 65.)

Solution: Let $X = \text{Binomial}(100, .7)$

X has mean

$$\mu = (100)(.7) = 70$$

and

$$\sigma = \sqrt{(100)(.7)(.3)} = \sqrt{21} = 4.58.$$

X will then be approximated by a *normal* distribution Y with the same mean and standard deviation.

$Y = N(70, 4.58)$.

Suppose 70% approve the President ...

You poll 100 people.

What is the probability that between 60 and 65 report approval?

(including 60 and 65.)

Solution: Let $X = \text{Binomial}(100, .7)$

X has mean

$$\mu = (100)(.7) = 70$$

and

$$\sigma = \sqrt{(100)(.7)(.3)} = \sqrt{21} = 4.58.$$

X will then be approximated by a *normal* distribution Y with the same mean and standard deviation.

$$Y = N(70, 4.58).$$

We can approximate $P(60 \leq X \leq 65)$ by $P(60 \leq Y \leq 65)$.

Suppose 70% approve the President ...

You poll 100 people.

What is the probability that between 60 and 65 report approval?
(including 60 and 65.)

X will then be approximated by a *normal* distribution Y with the same mean and standard deviation.

$$Y = N(70, 4.58).$$

We can approximate $P(60 \leq X \leq 65)$ by $P(60 \leq Y \leq 65)$.

The Z score of 60 is $\frac{-10}{4.58} = -2.18$.

The Z score of 65 is $\frac{-5}{4.58} = -1.09$.

So $P(60 \leq Y \leq 65) = P(Z < -1.09) - P(Z < -2.18) = .1379 - .0146 = .1233$.

Suppose 70% approve the President ...

Chapters 6, 17

Proof of
Normal
Approximation

You poll 100 people.

What is the probability that between 60 and 65 report approval?

(including 60 and 65.)

We can approximate $P(60 \leq X \leq 65)$ by $P(60 \leq Y \leq 65)$.

The Z score of 60 is $\frac{-10}{4.58} = -2.18$.

The Z score of 65 is $\frac{-5}{4.58} = -1.09$.

So $P(60 \leq Y \leq 65) = P(Z < -1.09) - P(Z < -2.18) = .1379 - .0146 = .1233$.

Actually $P(60 \leq X \leq 65) = .15036$.

So .1233 is not that good an approximation.

Suppose 70% approve the President ...

You poll 100 people.

What is the probability that between 60 and 65 report approval?

(including 60 and 65.)

We can approximate $P(60 \leq X \leq 65)$ by $P(60 \leq Y \leq 65)$.

The Z score of 60 is $\frac{-10}{4.58} = -2.18$.

The Z score of 65 is $\frac{-5}{4.58} = -1.09$.

So $P(60 \leq Y \leq 65) = P(Z < -1.09) - P(Z < -2.18) = .1379 - .0146 = .1233$.

Actually $P(60 \leq X \leq 65) = .15036$.

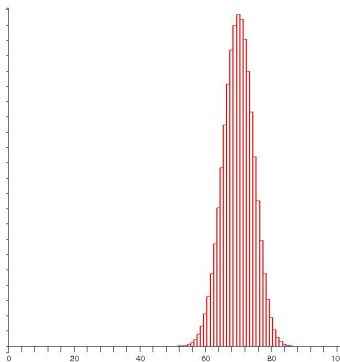

So .1233 is not that good an approximation.

$P(60 < X < 65) = .09509$. would also be approximated by .1233!

Normal Approximation of $X = \text{Binomial}(100, .7)$

For each $x = 0, 1, 2, \dots, 100$,

$$P(60 \leq X \leq 65) = .15036$$

$$P(60 < X < 65) = .09509$$

$$P(60 \leq Y \leq 65) = .1233$$

So $P(60 \leq X \leq 65) = .15036$ should be approximated by
 $P(59.5 \leq Y \leq 65.5)$.

Similarly $P(60.5 \leq Y \leq 64.5)$

$= P(Z < -1.20) - P(Z < -2.07) = .1151 - .0192 = .0959$ is
a great approximation to $P(60 < X < 65) = .09509$.

$X = \text{Binomial}(100, .7)$ and $Y = N(70, 4.58)$.

$$P(60 \leq X \leq 65) = .15036$$

$$P(60 < X < 65) = .09509$$

$$P(60 \leq Y \leq 65) = .1233$$

So $P(60 \leq X \leq 65) = .15036$ should be approximated by $P(59.5 \leq Y \leq 65.5)$.

This is called the continuity approximation.

You needn't use it on exams or homework!

(We suggest you not.)

Proof of
Normal
Approximation

Your textbook uses this as a synonym for a

unimodal and symmetric distribution.

This doesn't mean unimodal and symmetric distributions are necessarily well approximated by normal ones.

It is true that unimodal and symmetric does mean normality might be at least roughly indicative.

Some statistical methods derived under assumptions of normality can be shown to usually work more generally. I think this is what the authors really have in mind.

Suppose $X \sim \text{Binom}(2m, .5)$

We want to understand why $X \sim N(m, \sqrt{.5m})$ approximately.

Set

$$a_k = P(X = m + k) = \binom{2m}{m+k} (.5)^{2m}$$

i.e. $\ln a_k \sim \ln c - \frac{k^2}{m}$.

$$\begin{aligned} a_k &= \frac{(2m)! (.5)^{2m}}{(m+k)!(m-k)!} = a_0 \frac{(m)(m-1)\dots(m-k+1)}{(m+k)(m+k-1)\dots(m+1)} \\ &= a_0 \frac{(1)(1-\frac{1}{m})\dots(1-\frac{k-1}{m})}{(1+\frac{k}{m})(1+\frac{k-1}{m})\dots(1+\frac{1}{m})} \end{aligned}$$

Why Normal Out of Binomial?

Suppose $X \sim \text{Binom}(2m, .5)$

We want to understand why $X \sim N(m, \sqrt{.5m})$ approximately.

Set

$$a_k = P(X = m + k) = \binom{2m}{m+k} (.5)^{2m}$$

i.e. $\ln a_k \sim \ln c - \frac{k^2}{m}$.

$$\begin{aligned} a_k &= \frac{(2m)! (.5)^{2m}}{(m+k)!(m-k)!} = a_0 \frac{(m)(m-1)\dots(m-k+1)}{(m+k)(m+k-1)\dots(m+1)} \\ &= a_0 \frac{(1)(1-\frac{1}{m})\dots(1-\frac{k-1}{m})}{(1+\frac{k}{m})(1+\frac{k-1}{m})\dots(1+\frac{1}{m})} \end{aligned}$$

So using $\ln(1+x) \sim x$,

$$\ln a_k \sim \ln a_0 - 2 \left(\frac{1}{m} + \frac{2}{m} + \dots + \frac{k-1}{m} \right) - \frac{k}{m}$$

Set

$$a_k = P(X = m + k) = \binom{2m}{m+k} (.5)^{2m}$$

i.e. $\ln a_k \sim \ln c - \frac{k^2}{m}$.

So using $\ln(1+x) \sim x$,

$$\ln a_k \sim \ln a_0 - 2 \left(\frac{1}{m} + \frac{2}{m} + \dots + \frac{k-1}{m} \right) - \frac{k}{m}$$

But $1 + 2 + \dots + k - 1 = \frac{k(k-1)}{2}$, so

Why Normal Out of Binomial?

Suppose $X \sim \text{Binom}(2m, .5)$

We want to understand why $X \sim N(m, \sqrt{.5m})$ approximately.

Set

$$a_k = P(X = m + k) = \binom{2m}{m+k} (.5)^{2m}$$

i.e. $\ln a_k \sim \ln c - \frac{k^2}{m}$.

So using $\ln(1+x) \sim x$,

$$\ln a_k \sim \ln a_0 - 2 \left(\frac{1}{m} + \frac{2}{m} + \dots + \frac{k-1}{m} \right) - \frac{k}{m}$$

But $1 + 2 + \dots + k - 1 = \frac{k(k-1)}{2}$, so

$$\ln a_k \sim \ln a_0 - \frac{k^2}{m}$$

as desired.
