# **Difference Sets**

#### Definition

A ( $v, k, \lambda$ )-difference set is a subset D of a group G such that

- |*G*| = *v*
- |*D*| = *k*
- each nonidentity element g ∈ G, can be represented as a "difference" g = d<sub>1</sub>d<sub>2</sub><sup>-1</sup> for exactly λ pairs (d<sub>1</sub>, d<sub>2</sub>) ∈ D<sup>2</sup>.

▲圖 ▶ ▲ 国 ▶ ▲ 国 ▶ ……

# **Difference Sets**

#### Definition

A (v, k, λ)-difference set is a subset D of a group G such that
|G| = v

- |D| = k
- each nonidentity element g ∈ G, can be represented as a "difference" g = d<sub>1</sub>d<sub>2</sub><sup>-1</sup> for exactly λ pairs (d<sub>1</sub>, d<sub>2</sub>) ∈ D<sup>2</sup>.

Small Example:  $G = C_7 = \langle x \mid x^7 = 1 \rangle$ ,  $D = \{x, x^2, x^4\}$ . Difference Table:

D is a (7,3,1)-difference set

・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・

э

A Hadamard Difference Set (HDS) is a  $(v, k, \lambda)$ -difference set such that  $v = 4(k - \lambda)$ .

#### Theorem

For any  $(v, k, \lambda)$ -HDS,  $(v, k, \lambda) = (4m^2, 2m^2 \pm m, m^2 \pm m)$  for some  $m \in \mathbb{Z}_{>0}$ .

Because  $(4m^2, 2m^2 - m, m^2 - m)$ -difference sets and  $(4m^2, 2m^2 + m, m^2 + m)$ -difference sets are complementary, we will assume throughout that

$$(v, k, \lambda) = (4m^2, 2m^2 - m, m^2 - m).$$

イロト 不得 とくほ とくほ とうほ

Why study Hadamard Difference Sets?

- "The Hadamard parameters provide the richest source of known examples of difference sets."
- HDS's are deeply connected to design theory, coding theory, and digital communications.

(雪) (ヨ) (ヨ)

Why study Hadamard Difference Sets?

- "The Hadamard parameters provide the richest source of known examples of difference sets."
- HDS's are deeply connected to design theory, coding theory, and digital communications.

Why the name "Hadamard"?

 The (+1, -1) incidence matrix of the block design corresponding to an HDS is a regular Hadamard matrix.

< 回 > < 回 > < 回 > .

# The Group Ring

Let  $G = \{g_1, ..., g_n\}$  be a group, and  $D \subset G$  a difference set.

• We often work with the group ring  $\mathbb{Z}[G]$  of formal sums

$$\sum_{i=1}^n c_i \cdot g_i \qquad c_1, ..., c_n \in \mathbb{Z}$$

with addition and multiplication defined naturally.

• We often abuse notation to define elements  $D, G \in \mathbb{Z}[G]$  by

$$G:=\sum_{g\in G}g$$
  $D:=\sum_{d\in D}d$ .

▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ …

3

# The Group Ring

Let  $G = \{g_1, ..., g_n\}$  be a group, and  $D \subset G$  a difference set.

• We often work with the group ring  $\mathbb{Z}[G]$  of formal sums

$$\sum_{i=1}^n c_i \cdot g_i \qquad c_1, ..., c_n \in \mathbb{Z}$$

with addition and multiplication defined naturally.

• We often abuse notation to define elements  $D, G \in \mathbb{Z}[G]$  by

$$G:=\sum_{g\in G}g$$
  $D:=\sum_{d\in D}d$ 

Define

$$D^{(-1)} := \sum_{d \in D} d^{-1}.$$

• Under this notation, the condition for *D* to be a difference set is equivalent to *D* satisfying the equation

$$DD^{(-1)} = (k - \lambda) \cdot \mathbf{1}_G + \lambda \cdot G.$$

(本部) (本語) (本語) (二語)

## Example

 $G = C_7 = \langle x \mid x^7 = 1 \rangle$ ,  $D = \{x, x^2, x^4\}$  is a (7,3,1)-difference set

• In the group ring  $\mathbb{Z}[G]$ , we have  $D = x + x^2 + x^4$ , and  $D^{(-1)} = x^6 + x^5 + x^3$ . Thus

$$DD^{(-1)} = (x + x^2 + x^4)(x^6 + x^5 + x^3)$$
  
=  $(1 + x^6 + x^4) + (x + 1 + x^5) + (x^3 + x^2 + 1)$   
=  $3 + x + x^2 + x^3 + x^4 + x^5 + x^6$   
=  $2 + G$ .

◆□▶ ◆□▶ ★ □▶ ★ □▶ → □ → の Q ()

## Example

 $G = C_7 = \langle x \mid x^7 = 1 \rangle$ ,  $D = \{x, x^2, x^4\}$  is a (7,3,1)-difference set

• In the group ring  $\mathbb{Z}[G]$ , we have  $D = x + x^2 + x^4$ , and  $D^{(-1)} = x^6 + x^5 + x^3$ . Thus

$$DD^{(-1)} = (x + x^2 + x^4)(x^6 + x^5 + x^3)$$
  
=  $(1 + x^6 + x^4) + (x + 1 + x^5) + (x^3 + x^2 + 1)$   
=  $3 + x + x^2 + x^3 + x^4 + x^5 + x^6$   
=  $2 + G$ .

• Notice the relationship to the difference table from earlier:

#### Theorem

Let  $D \in \mathbb{Z}[G]$  be a  $(v, k, \lambda)$ -difference set. If  $g_0 \in G$  and  $\phi \in Aut(G)$ , then  $g_0\phi(D)$  is also a  $(v, k, \lambda)$ -difference set.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ○ ○ ○

#### Theorem

Let  $D \in \mathbb{Z}[G]$  be a  $(v, k, \lambda)$ -difference set. If  $g_0 \in G$  and  $\phi \in Aut(G)$ , then  $g_0\phi(D)$  is also a  $(v, k, \lambda)$ -difference set.

#### Definition

Two  $(v, k, \lambda)$ -difference sets  $D_1, D_2 \in \mathbb{Z}[G]$  are equivalent if there exists  $g_0 \in G$  and  $\phi \in Aut(G)$  such that  $D_1 = g_0\phi(D_2)$ .

# **Central Question**

- Existence: Which groups contain a difference set and which do not.
- Enumeration: Find all difference sets up to equivalence in a group or set of groups.

known results for Hadamard difference sets:

- *m* = 1 ⇒ 2 out of 2 groups of size 4 have HDS, 2 total difference sets (trivial)
- *m* = 2 ⇒ 12 out of 14 groups of size 16 have HDS, 27 total difference sets (Kibler)
- *m* = 3 ⇒ 9 out of 14 groups of size 36 have HDS, 35 total difference sets (Kibler/Smith)
- *m* = 4 ⇒ 259 out of 267 groups of size 64 have HDS (unpublished Davis/Smith)

・ロト ・ 同ト ・ ヨト ・ ヨト … ヨ

In our research we made extensive use of the computer algebra system GAP. In GAP you can

- enumerate over all groups of a given size
- program algorithms and techniques
- construct cyclic groups, dihedral groups, elementary abelian groups, direct products, semidirect products, ...
- list all elements, subgroups, normal subgroups, automorphisms, quotient groups, irreducible representations, etc. of a given group
- construct homomorphisms, isomorphisms, ...
- unambiguously refer to certain groups and group elements
- much much much more

・ロト ・ 同ト ・ ヨト ・ ヨト … ヨ

During our 8 weeks in San Diego we

- Programmed the construction techniques and special cases involved in determining the existence of difference sets in groups of order 64.
- Oeveloped an algorithm to exhaustively search groups of order 64 and enumerate all difference sets up to equivalence.
- Discovered and explored the use of "difference set transfers" for groups of order 16, 36, 64, and 144.

- It is very surprising that this works, and it doesn't only work occasionally. Many groups of order 64 "share" difference sets, and the same behavior can be found in some other orders.
- NEW PROJECT: Explain this voodoo!

(雪) (ヨ) (ヨ)

To approach the voodoo we moved back to groups of order 16, as in order 16

- we are still dealing with 2-groups,
- there are fewer total groups (14 compared to 267),
- similar voodoo behavior can be found (order 36 has some voodoo, but not as much),
- and we can easily find all difference sets and perform computations.

# Power Commutator Presentations - The Voodoo Source

GAP stores *p*-groups using power-commutator presentations.

#### Definition

Given a group *G* of order  $p^n$ , a *power-commutator presentation* of *G* consists of a set of generators  $\{f_1, f_2, ..., f_n\}$  with defining relations  $f_i^p = \prod_{k=i+1}^n f_k^{\beta(i,k)}$  and  $[f_j, f_i] = \prod_{k=j+1}^n f_k^{\beta(i,j,k)}$ , where the value of  $\beta$  is in  $\{1, ..., p-1\}$  and  $1 \le i < j \le n$ .

GAP stores *p*-groups using power-commutator presentations.

#### Definition

Given a group *G* of order  $p^n$ , a *power-commutator presentation* of *G* consists of a set of generators  $\{f_1, f_2, \ldots, f_n\}$  with defining relations  $f_i^p = \prod_{k=i+1}^n f_k^{\beta(i,k)}$  and  $[f_j, f_i] = \prod_{k=j+1}^n f_k^{\beta(i,j,k)}$ , where the value of  $\beta$  is in  $\{1, \ldots, p-1\}$  and  $1 \le i < j \le n$ .

The following theorem is due to Sylow.

#### Theorem

Every group of order p<sup>n</sup> has a power-commutator presentation on n generators.

・ロン ・四 と ・ ヨ と ・ ヨ と …

#### Example

We will look at a power-commutator presentation for  $D_8$ , the dihedral group of order 8.  $D_8 = \langle f_1, f_2, f_3 | f_1^2 = f_2^2 = f_3^2 = 1$ ,  $[f_2, f_1] = f_3, [f_3, f_1] = [f_3, f_2] = 1 \rangle$  Note that  $D_8$  is generated by just  $f_1$  and  $f_2$ , but these are not the traditional two generators of  $D_8$ . If we present  $D_8 = \langle r, s | r^4 = s^2 = 1, [r, s] = r^2 \rangle$ , then  $r = f_1 f_2$  and  $s = f_2$ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● ○ ○ ○

#### Observation

If a group *G* of order  $2^n$  has a power-commutator presentation over the set  $\{f_1, \ldots, f_n\}$ , then every element of *G* can be written as a product of  $f_i$ s in increasing order, e.g.  $f_1 f_3 f_4$ .

・ 同 ト ・ ヨ ト ・ ヨ ト …

#### Observation

# The Spread Construction

#### Definition

Let *G* be a group of order  $2^{2s+2}$  containing a normal elementary abelian subgroup  $E = C_2^{s+1}$ . *E* has  $2^{s+1} - 1$  subgroups  $H_i$  of order  $2^s$  (these subgroups are hyperplanes when viewing *E* as a vector space over  $\mathbb{F}_2$ ) and *E* partitions *G* into  $2^{s+1}$  cosets with coset representatives  $g_i$ . The set  $D = g_1H_1 + \cdots + g_{2^{s+1}-1}H_{2^{s+1}-1}$  is a difference set iff  $g_iH_ig_i^{-1}$  is a permutation of the  $H_i$ .

ヘロト ヘアト ヘビト ヘビト

# The Spread Construction

#### Definition

Let *G* be a group of order  $2^{2s+2}$  containing a normal elementary abelian subgroup  $E = C_2^{s+1}$ . *E* has  $2^{s+1} - 1$  subgroups  $H_i$  of order  $2^s$  (these subgroups are hyperplanes when viewing *E* as a vector space over  $\mathbb{F}_2$ ) and *E* partitions *G* into  $2^{s+1}$  cosets with coset representatives  $g_i$ . The set  $D = g_1H_1 + \cdots + g_{2^{s+1}-1}H_{2^{s+1}-1}$  is a difference set iff  $g_iH_ig_i^{-1}$  is a permutation of the  $H_i$ .

Key points:

- We need an elementary abelian subgroup of the appropriate size normal in *G*.
- The construction does not work for every set of coset representatives.
- However, if E is in the center of G then every set of coset representatives does work.

#### Theorem

Let G be a group of order 16 that does not contain a subgroup isomorphic to the quaternion group. If the socle of G has order 4, then every difference set in G can be generated via a spread construction over soc(G).

・ 同 ト ・ ヨ ト ・ ヨ ト …

#### Theorem

Let G be a group of order 16 that does not contain a subgroup isomorphic to the quaternion group. If the socle of G has order 4, then every difference set in G can be generated via a spread construction over soc(G).

A generalized version of this theorem would be very powerful, as it would reduce the search for all difference sets in a group to a search through all spread constructions. However, our proof relies to heavily on properties of difference sets in order 16 groups, and we have not been able to generalize it.

・ 同・ ・ ヨ・ ・

- Let  $G_i$  denote the group with GAP ID [16, i]
- $G_2, G_3, G_4$ , and  $G_{11}$  all have a socle of order 4, and do not contain a subgroup isomorphic to the quaternion group.
- In all of these groups  $soc(G) = \langle f_3, f_4 \rangle$ .
- Therefore, every single difference set in each of these groups is one of the 192 spread constructions over (*f*<sub>3</sub>, *f*<sub>4</sub>), and we then see why all of them have the same difference sets.
- Furthermore, in  $G_{10}$ ,  $G_{12}$ , and  $G_{14}$ ,  $\langle f_3, f_4 \rangle \subset Z(G)$ , so every spread over  $\langle f_3, f_4 \rangle$  is a difference set in all of these groups. Thus, we see why all of the difference sets in  $G_2, G_3, G_4$ , and  $G_{11}$  are difference sets in  $G_{10}, G_{12}$ , and  $G_{14}$ .

- *G*<sub>5</sub> also has a socle of order 4 and no subgroups isomorphic to the quaternion group.
- However,  $soc(G_5) = \langle f_2, f_4 \rangle$ .
- So, the difference sets in G<sub>5</sub> are exactly the spread constructions over (f<sub>2</sub>, f<sub>4</sub>).
- Because G<sub>10</sub> and G<sub>14</sub> all also have (f<sub>2</sub>, f<sub>4</sub>) in their center, every difference set in G<sub>5</sub> is also a difference set in these two groups.
- Also, we can show using other methods that every difference set in  $G_6$  is a spread over  $\langle f_2, f_4 \rangle$ , so every difference set in  $G_6$  is a difference set over  $G_5$ .

ヘロン 人間 とくほ とくほとう

- We used basic algebra to explain why  $G_{10}$  and  $G_{14}$  share all of their difference sets. This proof can then be generalized to show that all difference sets in  $C_2^{2s+2}$  are difference sets in  $C_4 \times C_2^{2s}$ , and vice versa.
- As alluded to above, we used basic group theory to show that all difference sets in  $G_6$  can be built with a spread construction over the unique normal  $C_2 \times C_2$ .
- We have found a way to classify every difference set in *G*<sub>8</sub> using subgroups isomorphic to the quaternions, and show that all of these difference sets are also difference sets in *G*<sub>9</sub>.

Dylan Peifer Difference Set Transfers

- There are still some unexplained transfers in groups of order 16.
- More data from order 64 would be useful for forming conjectures about transfers.
- Some of our results on transfers were used to answer existence questions in order 64 and order 144 groups.
